

CSIRO ACOUSTIC MEASUREMENT REPORT

Commonwealth Scientific and Industrial Research Organisation, Infrastructure Technologies Acoustics Testing Laboratory, Gate 5, 2 Normanby Road, Clayton, Vic 3168 Australia

Client: Woven Image Pty. Ltd.

37-39 Chard Road, Brookvale, NSW 2100 Australia

Measurement Type: Sound Absorption

AS ISO 354-2006 [R2016]: Acoustics-Measurement of sound absorption in a reverberation room

Test Specimen

<u>Description:</u> Woven Image 'Array - 24 mm Beam' Acoustic Baffle System – baffles installed at 300 mm centres using mounting elements from supplied mounting kit; Absorption area calculated per bafflemetre, per 1200 mm baffle and per 2400 mm baffle – see diagram below right.

- Test Specimen Details:1
- Baffles: EchoPanel® non-woven polymer fibre panel 100% PET (60% recycled), 24 mm thick ± 7%, area density: 3000 gsm; individual baffle height: 300 mm (rectangular in shape); 2 lengths: 1200 and 2400 mm; each baffle was made with cuts matching the cross-section of the Aluminium mounting extrusions included in the standard kit.
- Supplied for testing unassembled in standard kits with the installation components comprising:

 Mounting Rails: 2.5 m long aluminium extrusions of a proprietary profile designed to be directly fixed or suspended from the ceiling above and engage with matching cut-outs in the baffles for mounting.
 Ancillary Components: plastic joiners for longitudinal joining of mounting rails (or cut-down lengths), and end caps to cover the mounting rail ends, and aluminium snap covers to be cut to size and snapped into the open mouth of the mounting extrusion between adjacent baffles.

Installation:

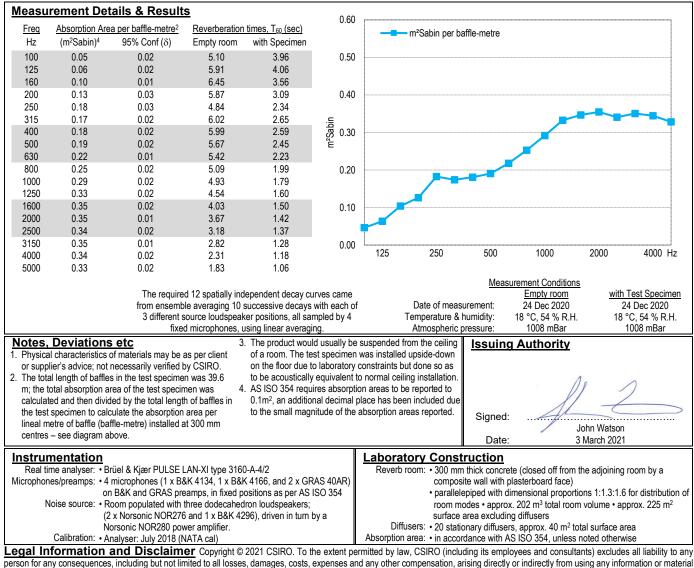

- The reverberation chamber was swept and vacuumed prior to testing to remove dust and debris.
- The test specimen was supplied as two standard kits, one in each of the two sizes (1200 and 2400 mm) plus some additional components as required to extend the mounting rails to accommodate eleven baffles at 300 mm centres.
- An array of each size (1200 and 2400 mm) was assembled, and then the two arrays were placed directly against each other to form a single array of 3600 mm baffles (x 11 rows at 300 mm centres).
- To replicate an in-situ direct-fix suspended ceiling installation within the constraints of the Laboratory, the test specimen was placed directly on the concrete floor of the test chamber not parallel with the walls of the chamber (13° angle), with no enclosure surrounding the test specimen.
- Apart from the upside down orientation³, installation was carried out as per manufacturer's instructions (Ref: ARRAY DIRECT FIX INSTALL GUIDE_MAR20.pdf).
- · Specimen assembly and installation was carried out by laboratory staff

Specimen as tested (image inverted to depict ceiling installation)

Additional calculations

At the request of the client, additional calculations were performed to provide data pertaining to the standard Woven Image 'Array - 24 mm Beam' Acoustic Baffle System product lengths (installed with 300 mm baffle separation) and tested resting directly against the room surface:

- 1200 mm
- 2400 mm

1/3 rd -octave centre frequency (Hz)	Array - 24 mm Beam (300 mm baffle separation; no gap between the specimen and room surface)			
	1200 mm baffle		2400 mm baffle
